2. **AI and Human Brain are *Structurally* Different**
3. **AI and Human Brain are *Functionally* Different**
4. **The Illusion of Consciousness**

1. Introduction

Introduction

One of the most common topics is the comparison between biological and artificial intelligence. Often, we superficially attribute human-like characteristics to AI systems, anthropomorphizing LLMs and chatbots, and even suggesting human-AI intimacy. [1] On the other hand, a deeper look clearly indicates the opposite conclusion.

These notes investigate why **the human brain and AI systems are intrinsically incomparable, both structurally and functionally** and, closely related, why **LLMs should not be considered conscious**.

[1] Potential and pitfalls of romantic Artificial Intelligence (AI) companions: A systematic review - Ho et al., Computers in Human Behavior Reports, 2025

2. AI and Human Brain are *Structurally* Different

AI and Human Brain are Structurally Different

The human brain has 86 billion neurons and 100 trillion synapses. We might intuitively think that once an AI system reaches this threshold, intelligence, or even consciousness, will naturally arise. However, recent studies argue that to reach the complexity of even one biological neuron, a modern deep neural network requires between five and eight layers of nodes [2]. Real neurons might be even more complex.

> *"The neuron teaches us something uncomfortable: computation isn't a lens revealing neural truth —* ***it's a filter that shows us only the biology that looks like a computer****. Everything else gets discarded before we even begin our analysis."* [3]

[2] Single cortical neurons as deep artificial neural networks - Beniaguev et al., Neuron, 2021

[3] Computation's Limits: What a Neuron Teaches Us - M. Palombi, ocrampal.com, 2025

AI and Human Brain are Structurally Different 💬

*"**The neuron operates across multiple timescales** without coordinating them, generates its own organizational principles without pre-specification, and contextually determines what causes what.*

*... [The neuron] **continuously reorganizes its own processing architecture** based on its history, current state, and environment. It creates new coupling rules, new timescale relationships, new responses that couldn't be predicted from its prior state.*

*... the ability to refuse based on context, history, and metabolic economics is precisely what makes the neuron alive and what makes it **incomputable**."* [3]

— **Computation's Limits: What a Neuron Teaches Us**, OCRAMPAL, 2025

AI and Human Brain are Structurally Different

- **The human brain is extremely sparse**. The probability of two neurons being connected is $\sim$ 1 in 100 million. This is in sharp contrast to AI models that show mostly dense organization.

- **The human brain is incredibly energy efficient**. It operates on about 20 watts of power. A recent study estimates biological computing is $\sim$ 1 billion times more efficient than its AI counterpart. [4]

[4] The energy challenges of artificial superintelligence - Stiefel & Coggan, Frontiers in AI, 2023

AI and Human Brain are Structurally Different

- **The human brain is subject to continuous learning**. It performs inference and learning concurrently, in real time.

- **The biological brain performs forward-only propagation** [5]. It replaces "back-propagation" with feedback loops and local learning rules.

- **The human brain is a non-von Neumann architecture.** Computation and memory are co-located. Knowledge spreads across a pattern of activity over many neurons and synapses. Computation is distributed and massively parallel. [6]

3. AI and Human Brain are *Functionally* Different

AI and Human Brain are Functionally Different

- Current AI models are **“stochastic parrots”**. [8]

> *“The algorithms don’t really "know" things the way we do. They do not understand anything. They learn mainly by **recognizing patterns** in their training data;*
>
> *... We don’t know how to infuse machines with knowledge beyond feeding them a set of facts."* [9]

[8] On the Dangers of Stochastic Parrots - Conference on Fairness, Accountability, and Transparency, 2021

[9] AI Is Nothing Like a Brain, and That's OK - Quanta Magazine, 2025

AI and Human Brain are Functionally Different

"Failure to distinguish belief from knowledge, and fact from fiction can mislead diagnoses, distort judicial judgments and amplify misinformation.

... while recent models show competence in recursive knowledge tasks, they still rely on inconsistent reasoning strategies, ***suggesting superficial pattern matching rather than robust epistemic understanding****."* [10]

— **Language models cannot reliably distinguish belief from knowledge and fact**, Nature, 2025

[10] Language models cannot reliably distinguish belief from knowledge and fact - Suzgun et al., Nature Machine Intelligence, 2025

AI and Human Brain are Functionally Different

"If we gather tons of data about the world, and combine this with ever more powerful computing power to improve our statistical correlations, then presto, we'll have AGI. Scaling is all we need.

But this theory is seriously scientifically flawed. ***LLMs are simply tools that emulate the communicative function of language, not the separate and distinct cognitive process of thinking and reasoning****, no matter how many data centers we build."* [11]

— **Large Language Mistake**,
Cognitive Resonance, 2025

[11] Large Language Mistake - B. Riley, Cognitive Resonance, December 2025

AI and Human Brain are Functionally Different

"using advanced functional magnetic resonance imaging (fMRI), we can see different parts of the human brain activating when we engage in different mental activities... solving a math problem, say, or trying understand what is happening in the mind of another human — different parts of our brains 'light up' as part of networks that are distinct from our linguistic ability.

... studies of humans who have lost their language abilities due to brain damage or other disorders demonstrate conclusively that this loss does not fundamentally impair the general ability to think.

... Studies suggest that children learn about the world in much the same way that scientists do— by conducting experiments, analyzing statistics, and forming intuitive theories of the physical, biological and psychological realms... Babies may not yet be able to use language, but of course they are thinking" [11]

— **Large Language Mistake**,
Cognitive Resonance, 2025

"LLMs learn spurious correlations between a prompt's syntactic template and specific domains. The model may incorrectly rely solely on this learned association when answering questions, ***rather than on an understanding*** *of the query and subject matter."* [12, 13]

[13] Learning the Wrong Lessons: Syntactic-Domain Spurious Correlations in Language Models - Shaib et al., arXiv, 2025

AI and Human Brain are Functionally Different

"Paradoxically, given the importance of deep learning, ***one key component of human intelligence remains out of reach for current AI models****:* ***the ability to learn as humans do****.*

... Our analysis shows that current AI systems are lacking are three key abilities that are found across the animal kingdom: the ability to select their own training data (active learning), the ability to flexibly switch between learning modes (meta control), the ability sense their own performance (meta-cognition)." [14]

— **Why AI systems don't learn and what to do about it**,
E. Dupoux et al., 2026

[14] Lessons on autonomous learning from cognitive science - E. Dupoux et al., 2026

- **AI models struggle to generalize beyond their training sets**. The classic example of this behavior is the accuracy disparity between English and non-English results.

> *"Performance in English vs. other languages.* ***All MLLMs exhibit consistent and strong performance in English****, attributable to the extensive availability of English training data and the emphasis on English during model development."* [15]
>
> — **A survey of multilingual large language models**, Patterns, 2025

[15] A survey of multilingual large language models - Qin et al., Patterns, 2025

"ChatGPT-4 and Gemini performed ***better in English compared to Arabic****. [ChatGPT-4 80% → 65%, Gemini 62.5% → 55%]"* [16]

Asadi et al., 2026

[17] Mirage: The Illusion of Visual Understanding - Asadi et al., arXiv, 2026

4. The Illusion of Consciousness

*"**Who is being deceived?***

***The general public, by the technology companies and organizations that benefit from the hype around AI**. These companies are in a race to develop the technology and are incentivized to promote the idea of human-like artificial general intelligence to secure funding and market dominance. Members of the scientific community, particularly those who are not directly involved in the race for AI funding, acknowledge the reality that AI is a set of specialized tools, rather than a unified intelligent entity. **This distinction is crucial, but it is blurred by commercial interests that amplify the illusion for monetary gain.**" [18]*

— **The intelligence illusion: why AI isn't as smart as it is made out to be**, Nature, Book Review, 2026

[18] The intelligence illusion: why AI isn't as smart as it is made out to be - Nature, Book Review, 2026

"Since the beginning of the boom in generative artificial intelligence, technology leaders have talked up the dangers of the very systems they're trying to sell. ***It's a paradoxical marketing strategy*** *and, unfortunately for some of the industries and companies deemed most vulnerable to disruption,* ***it's worked brilliantly****. Fear, it turns out, is the ultimate sales pitch."* [19]

— **AI's doomsday hype highlights the dark art of marketing**,
Straits Times, 2026

[19] AI's doomsday hype highlights the dark art of marketing - P. Olson, Straits Times, 2026

*"the association between consciousness and the computer algorithms used today... **is deeply flawed**. We believe that these flawed associations arise from a **lack of technical knowledge** and the way several new technologies (especially LLMs) work, which can create the **illusion of consciousness**.*

*... Unfortunately, because the remarkable linguistic abilities of **LLMs are increasingly capable of misleading people**, people may attribute imaginary qualities to LLMs."* [20]

— **There is no such thing as conscious artificial intelligence**,
Nature, 2025

[20] There is no such thing as conscious artificial intelligence - Porębski & Figura, Nature, Humanities and Social Sciences Communications, 2025

"conscious experience cannot be the downstream result of computation because it is the necessary physical prerequisite for it.

Furthermore, we show that ***computation is fundamentally a description, a map, that cannot physically instantiate what it describes***

... By creating increasingly powerful artificial intelligence we are not engineering a new form of life, but instead constructing increasingly accurate predictive maps. Yet, regardless of its predictive fidelity, its utility as a reasoning tool, or its physical embodiment, ***the artificial system remains categorically distinct from the territory of phenomenal experience.****"* [21]
