A (More) Objective View of AI

Implications for the Future

Federico Busato

2026-04-14

1. **Introduction**
2. **Unlikely Exponential Growth**
3. **Productivity Gain Uncertainty**
4. **Employment**

5. **Positive Impacts**
   - 5.1 Protein Structure Prediction
   - 5.2 Material Discovery
   - 5.3 Weather Forecasting
   - 5.4 Healthcare
   - 5.5 Learning
   - 5.6 Soften Polarization

6. **Negative Impacts**
   - 6.1 Environmental Risks
   - 6.2 Cognitive Offloading and Deskilling
   - 6.3 Echo Chamber
   - 6.4 Health Risks
   - 6.5 Social Risks

1. Introduction

AI Is Not Going Away

- **AI is not going away**. Blindly refusing AI is not the solution. Instead, it is fundamental to understand its capabilities and limitations.

> *"Love it or hate it, artificial intelligence (AI) is here, and it's not going away. As the technology evolves, AI will only become more prominent in our everyday interactions, shaping everything from how students learn to the work employees do at the office."* [1]
>
> — **AI Won't Take Your Job if You Know About IA**, Harvard Graduate School of Education, 2024

[1] AI Won't Take Your Job if You Know About IA - Dede & McCool, Harvard Graduate School of Education, 2024

2. Unlikely Exponential Growth

- **Fundamental Physical Limits of Transistors and Memory**.
  - The thermodynamic minimum gate length of a *transistor* will likely be reached by 2030, while the limits of photolithography are expected around 2029. [2]
  - *Memory bandwidth* has been increasing far more slowly than FLOP/s, at 30x in the last 20 years (1.5x/2yr), while FLOP/s have increased 90,000x in the same period (3x/2yr). This is a much more conservative constraint on potential AI growth. [3, 4]

[2] The Transistor Cliff - S. Constantin, 2023

[3] AI and Memory Wall - Gholami et al., IEEE Micro, 2024

[4] Challenges and Research Directions for Large Language Model Inference Hardware - Ma and Patterson, Google, 2026

- **Hardware Resource Constraints**. Reconstructing one cubic millimeter of human temporal cortex (~50-57k cells and ~130-150M synapses) generated 1.4 Petabytes of data. Scaling to the full human brain would require 1.6 zettabytes of storage costing $50 billion and spanning 140 acres. [5, 6]

- **Datacenters require 24/7 energy**. Solar and wind energy are not suitable for this purpose. On average, a nuclear power plant takes about 9.4 years to build, with an additional 3-4 years for the licensing process. [7]

[5] A Browsable Petascale Reconstruction of the Human Cortex - Blakely et al., Google, 2021

[6] Full scan of 1 cubic millimeter of brain tissue took 1.4 petabytes of data, equivalent to 14,000 4K movies - S. Grimm, Tom's Hardware, 2024

[7] Global nuclear reactor construction starts and duration, 1949-2023 - Cleveland & Mirkova, Boston University, 2024

Unlikely Exponential Growth

*"**The data center share of U.S. total electricity demand in 2030 ranges from 9% to 17%, an increase from 4-5% today**. At the state level, continued development of the largest DC market in Virginia implies a share increasing to between 39% and 57% by 2030."*

[8] Powering Intelligence 2026 - EPRI, 2026

Unlikely Exponential Growth

- **Running out of data**. AI training will exhaust its data by 2027, or by 2032 if the rate of computing growth slows down. [9]

- **AI quality degradation when trained on recursively generated data**. AI-generated content has surpassed the *quantity* of human-written articles. This implies that AI models are trained on increasingly low-quality data, reinforcing hallucinations. [10], [11], [12], [13]

---

[9] Will we run out of data? Limits of LLM scaling based on human-generated data - Villalobos et al., EpochAI, 2024

3. Productivity Gain Uncertainty

Productivity Gain Uncertainty

- The relationship between AI adoption and evidence of productivity gains is a *controversial topic*. Some research studies and economic data suggest that AI enhances productivity, while others show no benefits or even a negative impact.

> *"The AI productivity story in early 2026 is neither the revolution that vendors promise nor the disappointment that skeptics predict* ***-it's a transition whose timeline remains genuinely uncertain****.*
>
> *... History suggests AI's macro impact may similarly require a decade of complementary innovation before the statistics catch up to the promise."* [14]

[19] Firm Data on AI - National Bureau of Economic Research, 2026

Productivity Gain Uncertainty - Mixed Benefits 1/2

"AI tools didn't reduce work, they ***consistently intensified it****.*

... We identified three main forms of intensification: task expansion, blurred boundaries between work and non-work, and more multitasking.

... For workers, the cumulative effect is fatigue, burnout, and a growing sense that work is harder to step away from." [20]

— **AI Doesn't Reduce Work-It Intensifies It**,
Harvard Business Review

[20] AI Doesn't Reduce Work-It Intensifies It - Ranganathan & Ye, Harvard Business Review, 2026

Work is accelerating faster than the systems designed to manage it.

... Focus efficiency, the percentage of work time spent in focused, uninterrupted activity, declined to 60% – a three-year low. Risk of disengagement jumped 23%.

... AI is adding to workloads rather than redistributing them. Collaboration is expanding faster than attention can support it. Productivity gains are real but increasingly funded by fragmentation rather than depth.

... The data is unambiguous: AI does not reduce workloads. AI is being used as an additional productivity layer, not a substitute for existing work. [21]

— **2026 State of the Workplace**,
ActivTrak, 2026

[21] 2026 State of the Workplace - ActivTrak, 2026

Productivity Gain Uncertainty - Increased by AI

[22] Smothering Heights - M. Cembalest, J.P. Morgan, 2026

[23] We are Changing our Developer Productivity Experiment Design - Becker et al., METR, 2026

Productivity Gain Uncertainty - Increased by AI

Across 515 high-growth startups, we run a field experiment in which treated firms receive information about how other firms have reorganized production around AI, prompting them to search for use cases across a broader set of firm functions. We find that treated firms discover more AI use cases, a 44% increase, concentrated in product development and strategy. These changes result in economically meaningful performance gains. ***Treated firms complete 12% more tasks, are 18% more likely to acquire paying customers, and generate 1.9x higher revenue.*** [24]

4. Employment

Productivity Gain and Labor Markets

*"Across domains, **AI is better at amplifying human judgment than at replacing it**, rewarding those who can evaluate outputs and decide how to direct them toward useful ends.*

*... By making execution cheap, AI shifts value upstream toward cognitive tasks-judgment, problem framing, and integration–that are unevenly distributed and slow to acquire. As a result, access to AI alone is unlikely to equalize outcomes. **What matters is not whether workers can use AI but whether they can turn its output into useful work.**"*

— **AI raises the productivity bar**,
SCIENCE, 2026

[27] AI raises the productivity bar - WU & VASILESCU, SCIENCE, 2026

"AI has become the most powerful proactive frame available. 'We're restructuring around AI' is a growth signal. 'We over-hired during the pandemic and revenue softened' is an accountability signal.

... What makes AI washing corrosive is the confusion it creates, both inside and outside companies.

*... **And every incoherent account adds to the public's conviction that AI is eliminating jobs at a pace the data simply do not support.**"* [28]

— **The 'AI-Washing' of Job Cuts Is Corrosive and Confusing**, Bloomberg, 2026

[28] The 'AI-Washing' of Job Cuts Is Corrosive and Confusing - G. Mukunda, Bloomberg, 2026

*"**A flood of sometimes conflicting analyses shows the yawning gap between what little is known about how AI is changing work and everyone's understandable hunger for certainty**.*

... Economists say it's nearly impossible to forecast AI's effect on the labor market from the current capabilities of the technology or the business sectors it's seeping into first." [29]

— **See which jobs are most threatened by AI and who may be able to adapt**, The Washington Post, 2026

[29] See which jobs are most threatened by AI and who may be able to adapt - Schaul & Shira, The Washington Post, 2026

*"**we're sceptical that firms can quickly and seamlessly substitute workers with AI even in sectors where the potential for AI disruption is greatest**. What's more, some surveys suggest that AI use in larger US firms has recently stalled.*

*... Data from Challenger, Gray and Christmas suggests that AI-related US job losses are snowballing. In the first 11 months of 2025, AI was cited as a reason for almost 55,000 US job cuts, which accounts for over 75% of the reported AI-related job losses since the reason was first cited in 2023. However, these 55,000 or **so many AI-related job losses above account for only 4.5% of total reported job losses in the report**."* [30]

— **Evidence of an AI-driven shakeup of job markets is patchy**, Oxford Economics, 2026

[30] Evidence of an AI-driven shakeup of job markets is patchy - Oxford Economics, 2026

*"Despite headlines, **AI isn't the culprit behind slow hiring**. LinkedIn data shows **economic uncertainty, and monetary policy shifts are the primary drivers**. Advanced economies are struggling the most, with hiring down 20%-35% compared to pre-pandemic levels.*

*... Many roles as we have known them will undergo this transformation into new collar. In the past two years, **employers have created at least 1.3 million AI-related job opportunities.**"* [31]

— **Labor Market Report**,
LinkedIn, 2026

[31] Labor Market Report - LinkedIn, 2026

We find that thus far, ***there is no evidence of a reduction in job postings for industries or firms which have higher levels of AI adoption****. The overall slowdown in national job postings following the pandemic recovery does not appear to be driven (even modestly) by AI.* [32]

— **FEDS Notes**, 2026

[32] FEDS Notes - Board of Governors of the Federal Reserve System, 2026

*"Micro-level evidence suggests that AI generates **meaningful time savings** for many workers. At the macro level, in recent years industries with higher AI adoption rates have **experienced faster productivity growth**. While we do not establish causality, this relationship is statistically significant and similar in magnitude in Europe and the US."* [33]

— **Mind the Gap: AI Adoption in Europe and the U.S.**, National Bureau of Economic Research, 2026

[33] Mind the Gap: AI Adoption in Europe and the U.S. - National Bureau of Economic Research, 2026

"While anxiety over the effects of AI on today's labor market is widespread, our data suggests it remains largely speculative. The picture of AI's impact on the labor market that emerges from our data is one that ***largely reflects stability, not major disruption at an economy-wide level****."* [34]

— **Evaluating the Impact of AI on the Labor Market: Current State of Affairs**, Budgetlab, Yale University, 2025

[34] Evaluating the Impact of AI on the Labor Market: Current State of Affairs - Gimbel et al., Budgetlab, Yale University, 2025

"Young workers of all education levels are lagging the rest of the labor market. ***Focusing too much on education rather than age as the main labor market weakness starts us in the wrong direction****.*

So is AI nonetheless to blame for the broad-based weakness in the labor market for young people? It's true that some lower-skilled jobs can be replaced by AI. Call center workers and data entry jobs are potential examples. But there are not enough of these jobs to really drive the youth labor market." [35]

[66] A Rational Analysis of the Effects of Sycophantic AI - Batista et al., arXiv, 2026

*"More than 5 million US youth (13.1%) have sought mental health advice from AI, **with rates reaching 22.2% among 18- to 21-year-olds**. A 2025 study of adults with mental health conditions who use large language models reported nearly half use them for support, including for anxiety, depression, and personal advice. Users seek emotional support, companionship, psychoeducation, and help processing difficult experiences, likely between sessions and **sometimes instead of clinical care altogether**."* [67]

— **Patients Use AI-Clinicians Should Ask How**,
JAMA Psychiatry, 2026

[67] Patients Use AI-Clinicians Should Ask How - K. Saba & B. Weeks, JAMA Psychiatry, 2026

"The condition doesn't appear in the standard medical literature — because it doesn't exist. It's the invention of a team led by Almira Osmanovic Thunström, a medical researcher at the University of Gothenburg, Sweden, who dreamt up the skin condition and then uploaded two fake studies about it to a preprint server in early 2024.

... Even more troublingly, other researchers say, ***the fake papers were then cited in peer-reviewed literature****."* [68]

[68] Scientists invented a fake disease. AI told people it was real - C. Stokel-Walker, Nature, Feature News, 2026

The real danger to society is not that AI will actually become conscious, **but rather the risks that arise from *believing* it is**. We may grant legal rights or moral consideration to AI systems, or AI could be used to manipulate human users for commercial or **political gain**. [69], [70], [71], [72]

> *"Fusing LLM reasoning with multiagent architectures, these systems are capable of coordinating autonomously, infiltrating communities, and fabricating consensus efficiently.* ***By adaptively mimicking human social dynamics, they threaten democracy****."* [73]

"In debate pairs where AI and humans were not equally persuasive, ***GPT-4 with personalization was more persuasive 64.4% of the time****...Our findings highlight the power of LLM-based persuasion and have implications for the governance and design of online platforms."* [74]

— **On the conversational persuasiveness of GPT-4**, Nature, 2025

"I do not fear the rise of superintelligence.

I do, however, fear the rise of billionaires, organizations, and world powers who seek to use computing to maximize their power, influence, and control." [75]
